Block:

1. Lewis Diagrams
2. VSEPR

Lewis Diagrams

- Lewis diagrams show the bonding between atoms of a molecule.
- Only the outermost electrons of an atom (called valence electrons) are involved in bonding (usually just p and s)

Fill in the chart below to determine the valence electrons of elements 3-10

Element	Lithium	Beryllium	Boron	Carbon	Nitrogen	Oxygen	Fluorine	Neon
Group #	1	2	13	14	15	16	17	18
Full Electron Configuration	$1s^2 2s^1$	$1s^2 2s^2$	$1s^2 2s^2 2p^1$	$1s^2 2s^2 2p^2$	$1s^2 2s^2 2p^3$	$1s^2 2s^2 2p^4$	$1s^2 2s^2 2p^5$	$1s^2 2s^2 2p^6$
# of Valence Electrons	1	2	3	4	5	6	7	8

In general:  $n = \text{energy level}$

Main Group Number	1	2	13	14	15	16	17	18
Valence Electrons	1	2	3	4	5	6	7	8
Valence Electron Configuration	$ns^1$	$ns^2$	$ns^2 np^1$	$ns^2 np^2$	$ns^2 np^3$	$ns^2 np^4$	$ns^2 np^5$	$ns^2 np^6$

When drawing Lewis dot structures:

- Draw 1 dot for each valence electron
- Begin pairing dots only after you have put a dot on each side (north, east, south, west) of the atom

Draw the Lewis structures for the elements belonging to period 4 of the periodic table:

Group 1	Group 2	Group 13	Group 14	Group 15	Group 16	Group 17	Group 18
K	Ca	Ga	Ge	As	Se	Br	Kr

Draw the Lewis structures for the following atoms and ions:

Ba	Br	Br <sup>-</sup>	Bi	Al <sup>3+</sup>	Te
Ba	Br	$[:\ddot{\text{Br}}:]^-$	Bi	$[\text{Al}]^{3+}$	Te

Draw the Lewis structures for the ions of these elements:

Ca $\rightarrow$ group 2	Se $\rightarrow$ group 16	Ga	As	Cl
$[Ca]^{2+}$	$[:\ddot{Se}:]^{2-}$	$[Ga]^{3+}$	$[:\ddot{As}:]^{3-}$	$[:\ddot{Cl}:]^{-}$

### Lewis Structures for Molecules:

Example: NCl<sub>3</sub>

What to Think About	How to Do It
1. Figure out the total number of valence electrons in the molecule	N: 5 Cl: 7 x 3 = 21      21 + 5 = 26
2. Arrange the atoms. Assume that hydrogen and the halogens will not be the central atom	Cl   N   Cl Cl
3. Draw valence electrons around each atom	$\cdot\ddot{Cl}\cdot\quad\cdot\ddot{N}\cdot\quad\cdot\ddot{Cl}\cdot$ $\cdot\ddot{Cl}\cdot$
4. Connect unpaired electrons with a bond. Remember: there are two electrons in every bond. Some molecules may need double bonds. - H atoms form only one bond - O normally forms two bonds - N normally forms three bonds - C normally forms four bonds - Halogens normally form only one bond	$\cdot\ddot{Cl}-\ddot{N}-\ddot{Cl}\cdot$   $\cdot\ddot{Cl}\cdot$
5. Redraw the diagram from step 4 neatly.	$\cdot\ddot{Cl}-\ddot{N}-\ddot{Cl}\cdot$   $\cdot\ddot{Cl}\cdot$
6. Do a final check: <input checked="" type="checkbox"/> Do all the valence electrons in the diagram (bonds AND dots) match the total number of valence electrons from step 1? <input checked="" type="checkbox"/> Do all atoms follow the octet rule (8 electrons in the valence shell)?	

### Exceptions to the OCTET RULE:

1. The incomplete octet

- Elements in groups 1, 2 and 13 tend to form compounds in which they are surrounded by fewer than eight electrons
- Examples:

H<sub>2</sub>O

BF<sub>3</sub>

2. The expanded octet

- Atoms in period 3 or higher sometimes form compounds in which more than eight electrons surround the central atom.
- Example: SF<sub>6</sub>

3. Odd-electron molecules

- Some molecules contain an odd number of electrons.
- Odd-electron molecules are called radicals
- Example: NO<sub>2</sub>

With the above steps, construct Lewis structures for the following:

1. CCl <sub>4</sub>	2. NF <sub>3</sub>
<p><math>\text{Cl}-\text{C}-\text{Cl}</math></p>	<p><math>\text{F}-\text{N}-\text{F}</math></p>
3. H <sub>2</sub> O	4. H <sub>2</sub> Se
<p><math>\text{H}-\text{O}-\text{H}</math></p>	<p><math>\text{H}-\text{Se}-\text{H}</math></p>
5. NH <sub>3</sub>	6. OF <sub>2</sub>
<p><math>\text{H}-\text{N}-\text{H}</math></p>	<p><math>\text{F}-\text{O}-\text{F}</math></p>

## Lewis Structures for Molecules with Multiple Bonds:

1. CO<sub>2</sub>

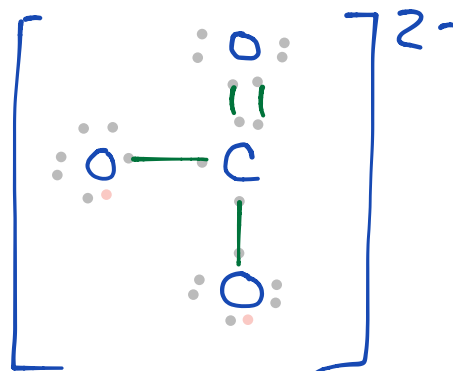

2. SO<sub>2</sub>

3. CH<sub>2</sub>O (\*hint: Carbon is the central atom)

4. CO<sub>3</sub><sup>2-</sup> (\*hint: 2- adds 2 electrons to the total number of valence electrons)

5. CN<sup>-</sup> (\*hint: - adds 1 electron to the total number of valence electrons)

6. SCO (\*hint: C is the central atom)

## More Practice!!

1.  $\text{PCl}_3$

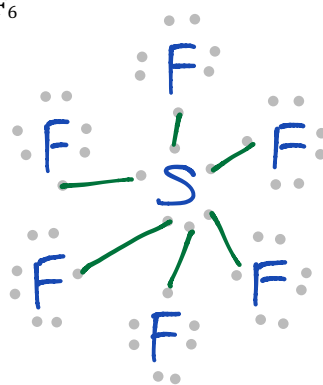

2.  $\text{PCl}_5$

3.  $\text{XeF}_6$

4.  $\text{SF}_6$

5.  $\text{C}_2\text{H}_6$

6.  $\text{CCl}_2\text{F}_2$

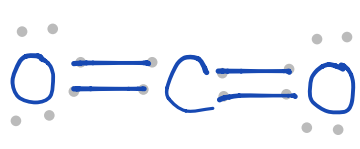

## VSEPR (Valence Shell Electron Pair Repulsion)

In order to understand the shapes the molecules form we must adhere to the same rules we have been following throughout this section

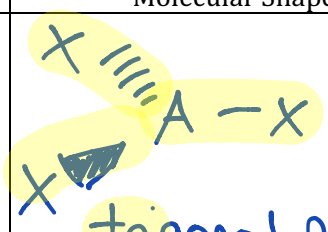

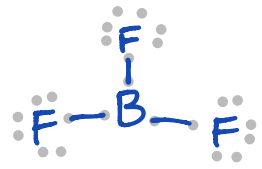

- Electrons all have the same negative charge
- Like charges repel
- Bonded pairs surrounding the nucleus repel other bonded pairs and other electrons
- Lone pairs surrounding the nucleus repel other bonded pairs and other electrons
- Valence electrons are oriented in such a way as to be as far from each other as possible

A = Central atom      X = Ligands (atoms bonded to A)      E = (Ligands electron pair)

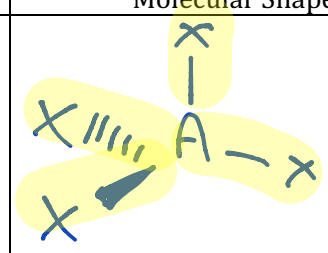

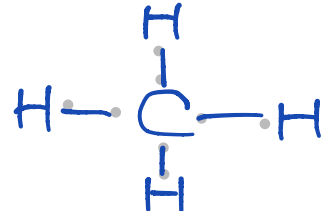

### Two-Bonding Electron Groups: AX<sub>2</sub>

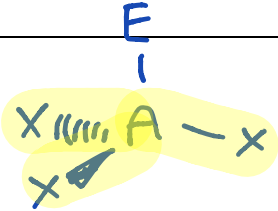

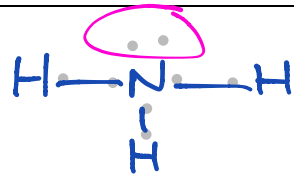

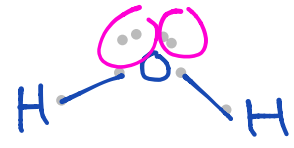

Notation & Shape Name	Molecular Shape	Sample Lewis Structure
AX <sub>2</sub>	X - A - X linear	 Carbon dioxide

### Three-Electron Groups: AX<sub>3</sub> and AX<sub>2</sub>E

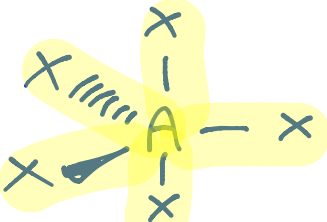

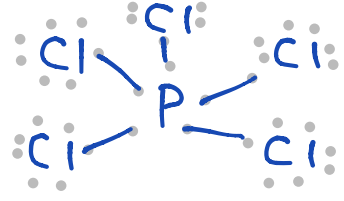

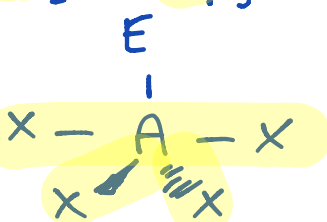

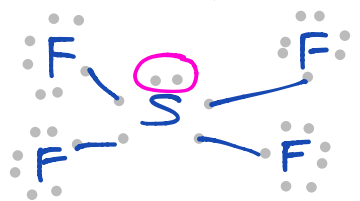

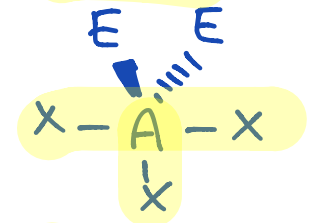

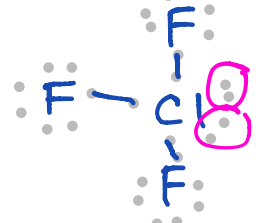

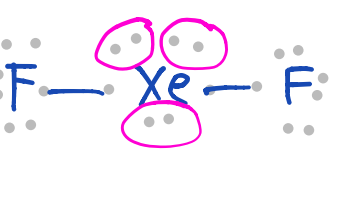

Notation & Shape Name	Molecular Shape	Sample Lewis Structure
AX <sub>3</sub>	 trigonal planar	 boron trifluoride
AX <sub>2</sub> E	 bent	 Sulfur dioxide

### Four-Electron Groups: AX<sub>4</sub>, AX<sub>3</sub>E and AX<sub>2</sub>E<sub>2</sub>

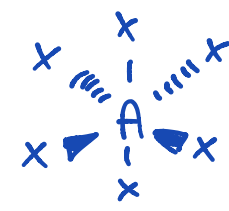

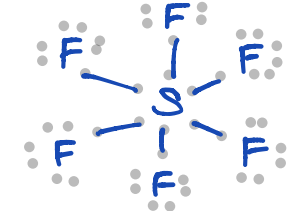

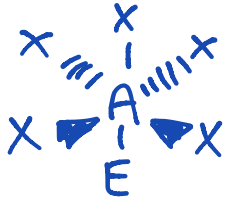

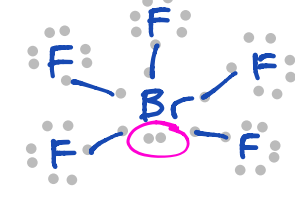

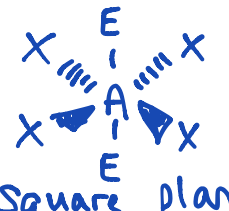

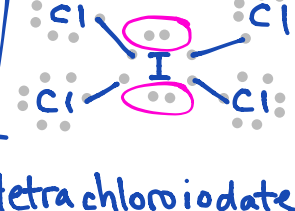

Notation & Shape Name	Molecular Shape	Sample Lewis Structure
AX <sub>4</sub>	 tetrahedral	 methane

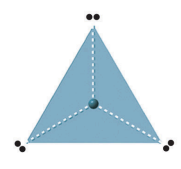

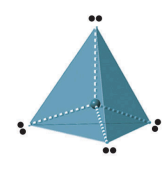

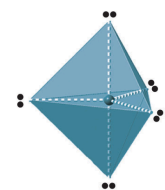

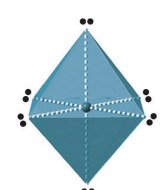

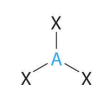

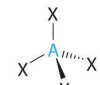

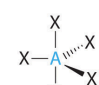

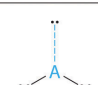

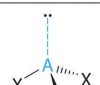

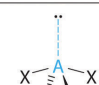

$AX_3E$	 <p>trigonal pyramidal</p>	 <p>ammonia</p>
$AX_2E_2$	 <p>bent</p>	 <p>Water</p>

**Five-Electron Groups:  $AX_5$ ,  $AX_4E$ ,  $AX_3E_2$ ,  $AX_2E_3$**

Notation & Shape Name	Molecular Shape	Sample Lewis Structure
$AX_5$	 <p>trigonal bipyramidal</p>	 <p>phosphorus pentachloride</p>
$AX_4E$	 <p>Seesaw</p>	 <p>Sulfur tetrafluoride</p>
$AX_3E_2$	 <p>T-shaped</p>	 <p>Chlorine trifluoride</p>
$AX_2E_3$	 <p>linear</p>	 <p>Xenon difluoride</p>

**Six-Electron Groups: AX<sub>6</sub>, AX<sub>5</sub>E, AX<sub>4</sub>E<sub>2</sub>**

Notation & Shape Name	Molecular Shape	Sample Lewis Structure
AX <sub>6</sub>	 Octahedral	 Sulfur hexafluoride
AX <sub>5</sub> E	 Square pyramidal	 bromine pentafluoride
AX <sub>4</sub> E <sub>2</sub>	 Square planar	 tetrachloroiodate ion

Electron Groups	2	3	4	5	6
<b>Molecular Geometry</b>	 Linear	 Trigonal planar	 Tetrahedral	 Trigonal bipyramidal	 Octahedral
<b>Zero Lone Pairs</b>	 Linear AX <sub>2</sub>	 Trigonal planar AX <sub>3</sub>	 Tetrahedral AX <sub>4</sub>	 Trigonal bipyramidal AX <sub>5</sub>	 Octahedral AX <sub>6</sub>
<b>One Lone Pair</b>		 Bent (V-shaped) AX <sub>2</sub> E	 Trigonal pyramidal AX <sub>3</sub> E	 Seesaw AX <sub>5</sub> E One axial lone pair	 Square pyramidal AX <sub>5</sub> E
<b>Two Lone Pairs</b>			 Bent (V-shaped) AX <sub>2</sub> E <sub>2</sub>	 T-shaped AX <sub>5</sub> E <sub>2</sub> Two axial lone pairs	 Square planar AX <sub>4</sub> E <sub>2</sub>
<b>Three Lone Pairs</b>				 Linear AX <sub>3</sub> E <sub>3</sub> Three axial lone pairs
